A SWEET NEW TAKE ON THE NEWS. The WSJ App for Android offers a sleeker, faster, better news experience with:Specifically designed for Android users, the new WSJ app delivers breaking news from the Journal's global network of award-winning reporters in a highly visual, compact modular interface. It's now easier than ever to get our trusted and authoritative news anytime, anywhere.Updated: June 16, 2015 Size: 7.7 MB Installs: 1,000,000 - 5,000,000 Current Version: 3.3.2 Requires Android 4.0 and up Content Rating: Everyone 10+ In-app Products: $0.99 - $22.99 per item Offered By: Dow Jones & Company, Inc.What's New 6/16 Update: Fixed memory issue. Thank you for downloading the latest edition of the WSJ app. Here are the key improvements in the new release: -Added stock tickers to articles so you can see relevant markets information -Updated our article layout for a cleaner, more modern look We're committed to constantly improving our app. If you have any questions, comments or suggestions please contact wsjmobileproduct@dowjones.com DOWNLOAD NOWDOWNLOAD ON THE APP STOREDOWNLOAD ON GOOGLE PLAYDOWNLOAD ON THE APP STOREDOWNLOAD ON THE APP STORE Copyright 2022 Dow Jones & Company, Inc. All Rights Reserved Privacy Policy | Cookie Policy Give your project a name, choose java and use lower level API so that your app can run on older version of android phones(I am using Api 16: Android 4.1 Jelly Bean).Step 2: Designing the User Interface of the appIn this app, we have used 4 components:a imageView- to show our given image for the song3 Buttons:a play button to play our songa pause button to pause our songa stop button to stop our song(Note: if we press play after pressing the pause then our song will continue playing immediately after where it was paused but if we press play button after stop then our song will play from the beginning)These components are implemented on the below two layouts:Vertical LinearLayoutHorizontal LinearLayoutInside the LinearLayout(vertical) there are two components:imageView componentLinearLayout(horizontal)This layout will vertically divide our app screen in two halves. The imageView component will be on upper half and the Horizontal Linear Layout will be on the lower half. The horizontal layout will contain three buttons (play, pause and stop button). This horizontal layout will align these three buttons one after another horizontally on the lower half of our app screen.To understand this clearly, please go through the following blue print and Component Tree of our app:In our app I have used different styles for play, pause and stop button by adding the following line of code:android:background="@android:drawable/ic_media_play" for play buttonandroid:background="@android:drawable/ic_media_pause" for pause buttonandroid:background="@android:drawable/ic_delete" for stop buttonHere geeksforgeeks logo is used in the app. Select the image and then paste it in the drawable directory. The path of the directory:project->app->src->main->res->drawableSet the id of all components and add the onClick methods with the buttons. Below is the XML code for the activity_main.xml file.   Step 3: Adding the music file to our appAdd the mp3 file to the raw folder. You can reach there by:app-> res-> rawIf there is no raw folder, then create it by right-clicking on res directory then:res-> new-> directoryName the newly created directory as raw and add all the audio files in this folder. Drag and drop files here is not allowed. You have to copy your source file, then right-click on the raw directory and click paste. Use "show in explorer" (if you are using windows) to go to that particular file. Make sure that the new name contains all small alphabets. The only valid characters are (a-z and 0-9 and _)Step 4: Let's code the functionality of our AppMake a object of MediaPlayer class named music. It is an inbuilt class in android package. All the properties of the MediaPlayer class can be used by this music object:MediaPlayer musicWe will add our music file to this newly created object by using create function :music = MediaPlayer.create(this, R.raw.sound);Please note that there is no need to add .mp3 or .wav or whatever filetype you are using. Just add the name of the file. (I have named my file as sound.mp3 so used R.raw.sound)MediaPlayer class has an inbuilt function called start we will use this function for play button. It will start the song.public void playSong(View v){music.start();} For pause button we will use the inbuilt function pause. This will pause the song.public void pauseSong(View v) {mp.pause();}For stop button we will use the inbuilt stop function. This function also deletes the object (music), so we create a new object with the same name.public void stopSong(View v) {mp.stop();};music = MediaPlayer.create(this, R.raw.sound);Note: The audio files are stored in the app, so make sure small files are addedThe complete Java code: MainActivity.java filepackage com.example.amusinz;import android.media.MediaPlayer;import android.support.v7.app.AppCompatActivity;import android.os.Bundle;import android.view.View;public class MainActivity extends AppCompatActivity {   MediaPlayer music;   @Override   protected void onCreate(Bundle savedInstanceState)   {   super.onCreate(savedInstanceState);   setContentView(R.layout.activity_main);   music = MediaPlayer.create(this, R.raw.sound);   }   public void musicplay(View v)   {   music.start();   }   public void musicpause(View v)   {   music.pause();   }   public void musicstop(View v)   {   music.stop();   music   = MediaPlayer.create(this, R.raw.sound);   }}Step 5: Let's Run our appClick the "Run" button at the Toolbar at the top to run our code.You can run your app two ways:using Android Virtual Device (emulator)by connecting your phone using USBYou must enable the developer options in your phone and set the USB debugging mode on to run your app.Please note that the emulator consumes a lot of RAM so your system should have enough ram to launch the emulator, it is recommended to use 4gb or more ram to increase the performance of your emulator. Get your music organised. Access it anywhere, anytime. Features include set lists function, hands-free page turning, and Dropbox sync. Bring freedom to your music - go digital with Orpheus sheet music reader for Android. Learn More View Discussion Improve Article Save Article Like Article ReadDiscussView Discussion Improve Article Save Article Like Article This article shows how to create an android application for displaying the Calendar using CalendarView. It also provides the selection of the current date and displaying the date. The setOnDateChangeListener Interface is used which provide onSelectedDayChange method. onSelectedDayChange: In this method, we get the values of days, months, and years that are selected by the user.Below are the steps for creating the Android Application of the Calendar. Step 1: Create a new project and you will have a layout XML file and java file. Your screen will look like the image below. Step 2: Open your xml file and add CalendarView and TextView. And assign id to TextView and CalendarView. After completing this process, the xml file screen looks like given below.Step 3: Now, open up the activity java file and define the CalendarView and TextView type variable, and also use findViewById() to get the Calendarview and textview. Step 4: Now, add setOnDateChangeListener interface in object of CalendarView which provides setOnDateChangeListener method. In this method, we get the Dates(days, months, years) and set the dates in TextView for Display. Step 5: Now run the app and set the current date which will be shown on the top of the screen.Complete code of MainActivity.java or activity_main.xml of Calendar is given below.
